What are the energy systems for EVs and HVS? After revealing the multidisciplinary technologies for EVs and HVs, the energy system technologies are discussed, with emphasis on energy source systems, battery charging and management systems, and vehicle-to-X energy systems. In this chapter, the electrochemical energy sources for electric vehicles (EVs) are discussed. What is energy systems for electric and hybrid vehicles? Electric and hybrid vehicles have been globally identified to be the most environmental friendly road transportation. Energy Systems for Electric and Hybrid Vehicles provides comprehensive coverage of the three main energy system technologies of these vehicles - energy sources, battery charging and vehicle-to-grid systems. Why is hybridization important in EV & HEV? Hybridization of energy sources in EVs and hybridization of powertrains in HEVs can significantly boost system efficiency and driving ranges of the EV and HEV. The onboard energy source is the most important part in drivetrain hybridization in the HEV and energy source hybridization in the EV. How can wireless power transfer systems help electric vehicles? By introducing wireless power transfer systems for electric vehicles, the obstacles of transferring energy to the vehicles can be resolved. The driver only needs to park the car and leave. Charging the vehicle's battery becomes an easy task. Why should you read electric/hybrid vehicles? Combining insights from an international team of authors, this book is essential reading for researchers and advanced students developing electric/hybrid vehicles and intelligent transport systems in industry and academia. Electric and hybrid vehicles have been globally identified to be the most environmental friendly road transportation. Are battery and supercapacitors a hybrid energy storage system? However, the storage system is still behind at performance and efficiency. Battery, as an electrochemical device, degrades over time losing the designed capacity until it needs replacement. In an effort to overcome this, a hybrid energy storage system (HESS) consisting of battery and supercapacitors is studied in recent years.
