

energy storage battery profitability analysis

Does a grid-level battery energy storage system perform energy arbitrage? The present work proposes a long-term techno-economic profitability analysis considering the net profit stream of a grid-level battery energy storage system (BESS) performing energy arbitrage as a grid service. Does battery degradation affect BESS profitability? We found that, even without degradation, the break-even investment cost that makes the BESS profitable with a power to-energy-ratio of 1 MW/2MWh is 210 \$/kWh. By implementing a cycle-counting degradation model, we observed a remarkable battery degradation on BESS profitability corresponding to a yearly net profit reduction in the 13-24 % range. Are battery energy storage systems a low-carbon flexible resource?

1. Introduction In the modern power network, battery energy storage systems (BESS) are playing a crucial role as low-carbon flexible resources, due to their ability to address renewable energy intermittency and to provide a wide range of grid services (e.g., energy arbitrage, frequency regulation, load-shifting) . What percentage of battery capacity is used for price arbitrage? Considering the U.S. wholesale electricity markets, >80 % of the battery capacity added in in the CAISO service territory was used for price arbitrage. In fact, as reported by the CAISO special report on battery storage , the largest positive revenue comes from day-ahead market energy schedules. How profitable is BESS for Energy Arbitrage grid applications? In fact, as reported by the CAISO special report on battery storage , the largest positive revenue comes from day-ahead market energy schedules. For this reason, it is crucial to properly analyze the profitability of using BESS for energy arbitrage grid applications. Are energy arbitrage profits overestimated? However, it is worth noting that previous research on energy arbitrage profits from the PJM market [26, 27] suggests that the perfect foresight assumption may lead to overestimation of arbitrage revenue, but by a modest percentage (10-15 %) when compared to simpler strategies that rely on back casting of recent historical prices. The present work proposes a long-term techno-economic profitability analysis considering the net profit stream of a grid-level battery energy storage system (BESS) performing energy arbitrage as a grid service. The present work proposes a long-term techno-economic profitability analysis considering the net profit stream of a grid-level battery energy storage system (BESS) performing energy arbitrage as a grid service. This paper analyzes the profitability of BESS in Greece, focusing on the Day-Ahead Market (DAM) and the Frequency Containment Reserve (FCR) market. To this end, we examine and compare the following three instances of BESS market participation with respect to the short-term uncertainty BESS It is a great tool to analyse the profitability of an investment independent of different lifetimes and account for inflation and degradation - two of the biggest impacts on profitability. future cash flows. Determining the appropriate discount rate and term of energy storage is the key to properly Home battery storage has reached a turning point in , with prices dropping to record lows and technology advancing rapidly. American homeowners can now install residential battery systems for an average of \$1,133 per kilowatt-hour (kWh), representing a 16% decrease from .
