Shipping tests and shipment We have an observation room from which you can see the manufacturing area through a window. Can bio-based thermal energy storage microcapsules be developed by spray drying? This study focuses on developing bio-based thermal energy storage microcapsules (MCs) by spray drying. New MCs were successfully prepared using ethyl laurate as the core material (phase change material; PCM), and gelatin as the outer shell. What size capsule is optimum for thermal energy storage? This size range appears optimum for thermal energy storage, as capsules of diameter ≤ 300 nm may see a decrease in latent heat due to low core-to-shell ratio. How to fabricate microcapsules with higher heat storage capacity? To fabricate microcapsules with higher heat storage capacity, it is necessary to increase the PCM content. Therefore, MCs were prepared by changing the mass ratio of PCM to gelatin (core/shell ratio). How do phase flow rates affect capsule size and shell thickness? Phase flow rates affect the capsule size and shell thickness in core-shell structures. Each type of shell presents its specific synthesis procedure for achieving the final stable carrier network. Biomedicine, food and cosmetic industry, self-healing, and thermal energy storage are among the main applications. How can I see the manufacturing process of capsule molding? 1.
