

energy storage industry lags behind national batteries

Are batteries the future of energy storage? Developments in batteries and other energy storage technology have accelerated to a seemingly head-spinning pace recently -- even for the scientists, investors, and business leaders at the forefront of the industry. After all, just two decades ago, batteries were widely believed to be destined for use only in small objects like laptops and watches. Are energy storage installations going up 61% this year? BloombergNEF team of analysts who follow the space are expecting this to continue, with energy storage installations rising 61% this year. Prices for turnkey energy storage systems are down 43% from a year ago, and that's leading to a big increase in deployments. Are battery manufacturers having hard times this year? Battery manufacturers are having hard times this year. LG Energy Solutions and Samsung SDI recently posted falling quarterly revenues and profits, while Panasonic's battery division missed its targets. Even the world's largest battery maker, CATL, reported its first drop in quarterly profit earlier this year. Is energy storage the future? The key conclusion of the research is that deployment of energy storage has the potential to increase significantly--reaching at least five times today's capacity by --and storage will likely play an integral role in determining the cost-optimal grid mix of the future. Will energy storage growth continue through 2025? With developers continuing to add new capacity, including 9.2 GW of new lithium-ion battery storage capacity in through November and comparable levels of growth expected through the fourth quarter of 2024, energy storage investments and M& A activity are expected to continue this trajectory through 2025. How much lithium-ion battery storage does the world need? Meng projects that a future version of the world that relies on clean energy will require between 200 TWh and 300 TWh of lithium-ion battery storage. That is an intimidating figure, she acknowledged, given that so far, the world's battery industry has achieved only 1 TWh annual production of lithium-ion battery capacity. Battery energy storage systems (BESS) are growing rapidly on the U.S. grid, but the technology has faced some headwinds. The primary technology being installed, lithium-ion storage facilities, have experienced fires that have some localities beginning to question the safety of living nearby.
