Why do we need thermal energy storage in data center? Due to specific operation conditions, high security and high cooling load is required in data center. To achieve energy saving, cost saving and high security, novel cooling systems integrated with thermal energy storage (TES) technologies have been proposed. What type of energy storage is used in data centers? What widely used in data centers is physical energy storage. Physical energy storage is further divided into sensible thermal energy storage (STES) and latent thermal energy storage (LTES). The commercial viability of LTES is limited by material characteristics and its initial cost, as opposed to STES that is mostly employed in data center. Are thermochemical energy storage materials available in data centers? Currently, various thermochemical energy storage materials are at development stage and such a system is not yet commercially available. What widely used in data centers is physical energy storage. Physical energy storage is further divided into sensible thermal energy storage (STES) and latent thermal energy storage (LTES). What is a good thermal storage material for a data center? Concrete, metal, water and air are sensible thermal storage materials usually seen. Water is generally used as cold energy storage material in data centers, because of its low price, high specific heat capacity and no pollution or corrosion. Why do data centers use aquifer thermal energy storage? When the data center operated at extreme high working load, the TES was employed to utilize the cold energy as a supplement cooling source. Aquifer is a kind of geological formation containing the groundwater, and it stores thermal energy seasonally. Aquifer thermal energy storage (ATES) consists of two wells. How does TES save energy in a data center? Solar energy and high quality heat of the data center was stored in TES to drive the absorption refrigerator, which provided cold energy to the data center. TES was integrated with the condenser to be cooled by the ambient air and provide cold energy to condenser. The PUE was decreased to 1.51. The energy saving rate reached 28%.
