Do energy storage stations improve frequency stability? With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies. Is energy storage a new regulatory resource? As a new type of flexible regulatory resource with a bidirectional regulation function [3, 4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market. What is frequency regulation power optimization? The frequency regulation power optimization framework for multiple resources is proposed. The cost, revenue, and performance indicators of hybrid energy storage during the regulation process are analyzed. The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established. What is the comprehensive efficiency evaluation system of energy storage? The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established. The multi-level power distribution strategy based on comprehensive efficiencies of energy storage is proposed. With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. How can FR Power optimization improve frequency stability? In order to improve the frequency stability, minimize FR control costs, and rationalize the revenue allocation between FR resources, a double-module FR power optimization strategy is proposed considering the cost, performance, and revenue of TPU and ES. The significant innovations of this paper can be described as follows: Why are FR benefits primarily compensated to ES6 and ES5? FR benefits are primarily compensated to ES6 and ES5 because they take on the majority responsibility of power output. Additionally, ES units with the same capacities, such as ES1 and ES2, ES3 and ES4, output the same FR power and obtain the same benefits.
