

how pumped hydro storage can improve efficiency

Efficiency Improvement: New technologies allow for variable speed operation, providing flexibility in both pump and turbine modes. This enhances grid stability by offering rapid frequency support in both directions. Given the critical role pumped hydro storage plays in being a clean, low-cost and renewable energy storage system, is simply maintaining key hydropower equipment (such as Kaplan and Francis turbines) enough? Or, should a more rigorous approach be undertaken to intrinsically 'improve' the efficiency
