Why do military vehicles need energy storage systems?The critical operations of military vehicles present unique requirements for the energy storage system because it requires high energy capacity as well as high power capability . In existing studies, the power and torque ratings of the traction motor were decreased by using a two-stage gear transmission [6, 7]. Why do military vehicles have high power and high energy capacity?In military vehicles, both high power and high energy capacity are important for mission implementation. Li-ion battery has a high energy density, but its low power density leads to a higher mass of the energy storage system. In this study, the battery and capacitor were combined together to satisfy the energy storage requirements. Is hybrid energy storage a good option for military vehicles?As given in Table 3, the hybrid energy storage provides a maximum power that is 53% more than the battery of the series configuration. This high maximum power capacity offers the potential to incorporate additional auxiliary devices in a military vehicle that require high instantaneous power. Can a hybrid electric powertrain be used in military vehicles?In this study, the development of a hybrid electric powertrain was done by considering the mobility attributes of military vehicles. The proposed configuration replaced the battery and single-speed transmission with a hybrid energy storage system and multi-speed transmission. The main conclusions of this study can be summarized as: What makes a military vehicle a good vehicle?Military vehicles are designed to satisfy different operating conditions such as high-speed operations, cross-country travel, and hilly drive. In the case of a military vehicle, gradeability performance is very crucial, which requires very high torque. Does a military hybrid drive cycle improve fuel economy?The drive cycle used for the analysis of military hybrid vehicles has a high impact on fuel economy improvement . A review of the literature showed that many different military drive cycles were used to evaluate vehicle performance. Some studies used a mix of these cycles to report the fuel economy improvement. As military operations evolve, the need for reliable, efficient, and flexible energy sources has never been more crucial. These vehicles serve a dual purpose: they not only supply energy to remote installations but also facilitate energy independence on the battlefield.
