

## profit analysis of lithium iron new energy storage

Is energy storage a profitable business model? Although academic analysis finds that business models for energy storage are largely unprofitable, annual deployment of storage capacity is globally on the rise (IEA, ). One reason may be generous subsidy support and non-financial drivers like a first-mover advantage (Wood Mackenzie, ). How can energy storage be profitable? Where a profitable application of energy storage requires saving of costs or deferral of investments, direct mechanisms, such as subsidies and rebates, will be effective. For applications dependent on price arbitrage, the existence and access to variable market prices are essential. Does energy arbitrage affect lifetime profit? Case study focussed on energy arbitrage on the intraday electricity market. Recent electricity price volatility caused substantial increase in lifetime profit. Lithium-ion cells are subject to degradation due to a multitude of cell-internal aging effects, which can significantly influence the economics of battery energy storage systems (BESS). Are lithium-ion batteries aging? Following the cost reductions and technological advances of recent years, lithium-ion cells are now the predominant battery technology for BESS installations, . However, like other battery types as well, lithium-ion batteries are subject to degradation due to a multitude of cell internal aging mechanisms. Why should you invest in energy storage? Investment in energy storage can enable them to meet the contracted amount of electricity more accurately and avoid penalties charged for deviations. Revenue streams are decisive to distinguish business models when one application applies to the same market role multiple times. As of March , lithium iron phosphate (LFP) battery storage installations have grown 240% year-over-year, yet over 60% of operators report profit margins below 8% . This paradox defines today's energy storage landscape where surging demand meets complex economic realities. This paradox defines today's energy storage landscape where surging demand meets complex economic realities. The global energy storage market, worth \$33 billion annually [1], isn't just about lithium-ion batteries anymore. From flywheels spinning faster than Formula 1 engines to vanadium redox flow batteries that work like liquid fuel tanks, the game has changed. Who's watching this space? Three main As of March , lithium iron phosphate (LFP) battery storage installations have grown 240% year-over-year, yet over 60% of operators report profit margins below 8% . This paradox defines today's energy storage landscape where surging demand meets complex economic realities. Let's examine a Global demand for Li-ion batteries is expected to soar over the next decade, with the number of GWh required increasing from about 700 GWh in to around 4.7 TWh by (Exhibit 1). Batteries for mobility applications, such as electric vehicles (EVs), will account for the vast bulk of demand in Increasing the lifetime profitability of battery energy storage In a case study, the application of generating profit through arbitrage trading on the EPEX SPOT intraday electricity market is investigated.
