How can ice thermal energy storage reduce the cost of HVAC systems? Many methods have been introduced to reduce energy consumptions and the costs of HVAC systems. Along with reducing the operating cost of HVAC systems, ice thermal energy storage (ITES) systems, also called the ice storage system (ice-ss or ISS), have significant advantages in decreasing the peak cooling loads and the capacity of chillers. How much natural gas is used for ice storage? The annual natural gas consumption cost for heating is 295,000 TL, and 375,000 TL for the ice storage integrated heat pump. The payback period of the ice storage integrated AC and heat pump system is observed to be 4.5 years. It may provide almost 8 million TL savings at the end of 10 years. Can ice-SS be used as heat source for heating purposes? This study investigates the use of ice-ss as the heat source of heat pump for heating purposes. The proposed system is paid its investment back in 4.5 years. It can provide 8 million TL saving in the 10 operational years. It helps to reduce the use of fossil fuels for heating purposes. Can ice storage be used in heat pumps? At the end of the present study, it is reached that the ice storage system has a promising potential to use in heat pumps as a low-temperature energy source. Also, it provides a more environmentally friendly heating operation as it does not require fossil fuels by removing the furnaces or provides higher COP for heat pumps.
