What is deep sea pumped hydro storage? Deep sea pumped hydro storage is a novel approach towards the realization of an offshore pumped hydro energy storage system (PHES), which uses the pressure in deep water to store energy in hollow concrete spheres. The spheres are installed at the bottom of the sea in water depths of 600 m to 800 m. How efficient is an underwater energy storage system? A novel underwater energy storage system is introduced and its round-trip efficiency is reported. A validated analytical model is used to predict the performance of a scaled-up system. Its performance is comparable to that of conventional pumped hydro systems. New elements such as a flexible reservoir do not contribute to energy losses. What is pumped Energy at Sea (StEnSEA)? "Storing Energy at Sea (StEnSea)" is a novel pumped storage concept for storing large amounts of electrical energy offshore. In contrast to well-known conventional pumped-hydro power plants, this concept greatly expands the siting possibilities, and allows for modular construction and ease of assembly.
